

AI & Machine Learning for Civil Engineers

From engineering data to prediction, explainability and uncertainty, in eight hands-on sessions.

08

Live sessions

90 min

Per session

04 weeks

Course duration

Runs 100% on Google Colab
Nothing to install, works even on a Chromebook

Built for beginners
No prior Python or machine learning required

Live code-along on Civil Engineering datasets
Materials · Buildings & Energy · Transport · Environment · Geotechnics

Hands-on notebooks, cross-domain assignments & solutions
Plus certificate & recordings (till 2 weeks after the course)

Course outline

01 Python for Civil Engineers
AI/ML basics, Colab, NumPy & pandas with engineering data

02 From Raw Data to ML-Ready
Explore, clean, visualize & split engineering data

03 Your First Prediction Model
Linear regression, error metrics & cross-validation

04 Trees & Ensemble Models
Decision Trees, Random Forest & boosting for nonlinear problems

05 Classification for Engineering Decisions
Logistic regression, confusion matrix, precision & recall

06 Artificial Neural Networks
Architecture, activations, training & overfitting

07 Explainable AI & Engineering Judgement
Feature importance, SHAP, and engineering interpretation

08 From Prediction to Probability
Monte Carlo, ML surrogates & probability of failure

Designed for Civil Engineers across disciplines — Materials, Structures, Geotechnics, Transportation, Water & Environment.

INSTRUCTOR

Dr. Abdul Waris

Research Associate

Universität Siegen (University of Siegen)

Former Prime Minister's Research Fellow

Ph.D. in Geotechnical Engineering, IIT Hyderabad

Research Excellence Award 2026, IIT Hyderabad

Invited talks at Oregon State University (USA) and a Faculty Development Programme at D.Y. Patil (Pune, India)

Resource person, five-day ML workshop at NIT Srinagar

WHO SHOULD JOIN

B.Tech & M.Tech students / PhD scholars / Faculty / Practising engineers / Complete beginners to AI & ML

**Saturday,
17 October 2026**

Scan to register · qudelastudios.com →

Most ML courses start with algorithms. This one starts with engineering problems.

One ML workflow. Multiple civil engineering applications. Every session follows the workflow you would use on a real project.

	Define the problem Which mix-design inputs drive concrete strength?	01
	Understand the data Explore, clean and check it before you trust it.	02
	Build a model Regression, trees, ensembles and neural networks.	03
	Validate it Test on data the model has never seen.	04
	Interpret it Does the model respect engineering physics?	05
	Decide responsibly Account for uncertainty before acting on a prediction.	06

DESIGNED FOR CIVIL ENGINEERS ACROSS DISCIPLINES

-  Materials
-  Structures
-  Geotechnics
-  Transportation
-  Water & Environment
-  Buildings & Energy

Built for civil engineers at every stage.

Whether you are still studying or already on site, you will leave able to apply ML to your own engineering problems.

UG students
B.Tech / B.E. in civil engineering

PG students
M.Tech / M.E. in any civil specialisation

PhD scholars
and early-career researchers

Faculty members
bringing data-driven methods into teaching

Practising engineers
structural, geotech, transport, water

Complete beginners
never written a line of Python? Perfect.

What you need ✓ Basic civil engineering concepts ✓ Comfort with everyday engineering calculations ✓ A Google account and a web browser	What you don't ✗ Prior Python or programming ✗ Prior machine learning experience ✗ Advanced mathematics ✗ Anaconda, MATLAB or any installs
---	---

By the end, you'll be able to...

	Frame engineering problems for ML Turn a civil engineering question into inputs, features and a target.	01
	Wrangle real engineering data Explore, clean and prepare datasets with Python, NumPy and pandas.	02
	Predict engineering quantities Build regression models for strength, response and performance.	03
	Support engineering decisions Build classifiers and judge them with precision, recall and F1.	04
	Choose the right model Compare linear, tree-based, ensemble and neural-network approaches.	05
	Validate like an engineer Catch data leakage, overfitting and unsafe extrapolation.	06
	Explain what the model learned Use feature importance and SHAP to test physical plausibility.	07
	Quantify uncertainty Estimate probability of failure with Monte Carlo and ML surrogates.	08

Sessions 01–04: the foundations.

Python, data preparation, regression and nonlinear models, on real civil engineering data.

01

Python for Civil Engineers

 **Application** · Concrete compressive strength

AI/ML basics, Colab, NumPy & pandas with engineering data.

AI/ML concepts

Google Colab

Python

NumPy

pandas

First plots

02

From Raw Data to ML-Ready

 **Application** · Concrete + cross-domain engineering data

Explore, clean, visualize & split engineering data.

EDA

Data quality

Outliers

Correlations

Train/test split

Scaling

Leakage

03

Your First Prediction Model

 **Application** · Concrete compressive strength

Linear regression, error metrics & cross-validation.

Linear regression

MAE · MSE · RMSE

R^2

Residuals

Cross-validation

04

Trees & Ensemble Models

 **Application** · Concrete + geotechnical response

Decision Trees, Random Forest & boosting for nonlinear problems.

Decision trees

Random Forest

Boosting

Model comparison

A real engineering dataset is used in every session. Hands-on examples from Materials • Structures • Buildings & Energy • Transport • Water & Environment • Geotechnical Engineering.

Sessions 05–08: prediction to decision.

05

Classification for Engineering Decisions

 **Application** · Environmental / water + geotechnical classification
Logistic regression, confusion matrix, precision & recall.

- Logistic regression
- Decision trees
- Confusion matrix
- Precision · Recall · F1

06

Artificial Neural Networks

 **Application** · Concrete & engineering response prediction
Architecture, activations, training & overfitting.

- ANN architecture
- Activation
- Loss
- Epochs
- Overfitting
- Convergence

07

Explainable AI & Engineering Judgement RESEARCH AREA

 **Application** · Geotechnical research case study
Feature importance, SHAP, and engineering interpretation.

- Feature importance
- Permutation importance
- SHAP
- Extrapolation
- Physical plausibility

08

From Prediction to Probability RESEARCH AREA

 **Application** · Reliability / engineering exceedance
Monte Carlo, ML surrogates & probability of failure.

- Monte Carlo simulation
- Surrogate models
- Probability of failure
- Uncertainty

Beyond a typical ML course: sessions 07 and 08 draw directly on the instructor’s research in explainable ML and reliability analysis.

Fewer slides. More code.

Every 90-minute session is live and instructor-led, and roughly half of it is spent writing code together.

Short concept explanations, then hands-on coding, then what the results mean for an engineer.

Live instructor-led coding

Code is written live with you, not pasted from slides.

Step-by-step notebooks

Every step explained in plain language inside the notebook.

Worked example, then your turn

Guided exercises follow every demonstration.

Assignments with solutions

Practise on your own, then compare with the instructor's.

Engineering discussion

Ask questions and debate what the results really mean.

Session recordings

Shared after each session; available until two weeks after the course ends.

Engineering judgement is built in. Every session discusses model limitations, validation, extrapolation and physical plausibility, not just accuracy.

Real engineering data. Right in your browser.

● Google Colab · Python 3

```
[1] import pandas as pd
df = pd.read_csv("concrete_strength.csv")
df.shape

(1030, 9)

[2] from sklearn.model_selection import train_test_split
X, y = df.drop(columns="strength_mpa"), df["strength_mpa"]
X_tr, X_te, y_tr, y_te = train_test_split(X, y, test_size=0.2)

[3] from sklearn.linear_model import LinearRegression
model = LinearRegression().fit(X_tr, y_tr) # your first model
```

SciPy

08/11

Dr. Abdul Waris

Research Associate

Universität Siegen (University of Siegen)

Former Prime Minister’s Research Fellow

Ph.D. in Geotechnical Engineering, IIT Hyderabad

A computational geomechanics researcher who uses machine learning, reliability analysis and uncertainty quantification to make engineering decisions safer. His Ph.D. developed data-driven frameworks for the reliability analysis of slopes under rainfall.

- Scientific ML
- Explainable AI
- Surrogate modelling
- Reliability analysis
- Uncertainty quantification
- Offshore geotechnics

ACADEMIC JOURNEY

2016 – 2020

B.Tech, Civil Engineering

IUST, Awantipora

🏆 Ranked 2nd in a batch of 120+

2020 – 2022

M.Tech, Geotechnical Engg.

NIT Durgapur

🏆 Institute Gold Medalist

2022 – 2026

Ph.D., Geotechnical Engg.

IIT Hyderabad

🏆 PM Research Fellow · Research Excellence Award 2026

2026 – NOW

Research Associate

Universität Siegen, Germany

🎓 Teaches & supervises Master’s students

WORKS WITH

- Python
- MATLAB
- PLAXIS
- ABAQUS
- HYDRUS
- GIS
- AutoCAD

10

8

9

4

10 / 11  

Everything you need, included.

No software to buy and nothing to install. Every notebook opens straight in Google Colab.

8 hands-on notebooks

Structured Colab notebooks, one per session

Curated datasets

Cleaned, with data dictionaries

Cross-domain assignments

Practice problems across civil disciplines

Solution notebooks

Full instructor solutions to compare

Python & ML quick reference

A cheat sheet to keep at your desk

Session recordings

Available until two weeks after the course ends

COHORT FALL 2026 · LIMITED SEATS

Starts Saturday, 17 October 2026

-  8 live sessions
-  90 min each
-  4 weeks
-  Certificate
-  100% online

REGISTER NOW
